

Carbon Compensated Gas (CCG) on enmacc

Overview

For the first time, voluntary emission reduction certificates will be available to purchase alongside the purchase of natural gas. As part of this feature, the number of VER certificates needed to compensate for the combustion¹ of the purchased gas will be automatically calculated, with the buyer able to optionally add these certificates to their purchase.

CCG on enmacc platform

Gas suppliers have the option to quote for VERs at the same time as providing gas quotes. Initiators of RFQs to purchase gas are able to optionally add the VER certificates, with the

all purchase prices being automatically calculated.

¹ Conversion factor of 0.202 tCO₂ / MWh gas will be used

Collaborating suppliers

As of June RWE is offering VERs. Further suppliers will follow and compliment the offering.

- RWE
 - *VER standards: VCS, minimum vintage*

How to benefit

Demand side players benefit from this immediately. Qualifying RFQs for purchase of gas will include the option of added VERs when quoted by suppliers.

Gas suppliers are encouraged to contact us in order to set up the feature.

Trading fee & billing

For each successful trade of VERs, enmacc will charge 0.1 EUR / tCO₂e to each party. This will be billed in the normal billing cycle together with the gas trade.
